I went to this address to test NoSpamToday system, which I'm pretty happy with. I found that 3 emails got through, one had an embedded virus which wasn't detected by Clam or Norton. The other 2 were .dat files which also were not detected. There were 25 emails in the test only 3 got through. That's pretty good but I'm looking for 100% effectiveness.

Here's the test address.

<http://www.webmail.us/testvirus>

Any ideas?
