
Subject: No Spam Today - causing server to lock up

Hi,

I have been running our win 2003 server's POP3 & SMTP service on the server now for a few months without spam until one day, spam caught up with us (along with viruses).

Just purchased the 25 License along with 2 years subscription with NOD32 antivirus to fight off the spam and viruses getting sent to the mailboxes.

Anyway, when I set the allowed email filter to '*@domain.com' and a flood of spam went through, the server would lock up.

I then limited the allowed list to individual email addresses - and it's still locking up.

When you send to an individual address (or even everyone in the list - which is 18 mailboxes) it doesn't freeze the server.

And when I mean it freezes the server, I mean all the services are running, but no one can access shared folders, and when I log into the server, I cannot execute anything.

This has only started since No Spam Today was installed - it had a virus scanner before on it and so on, and didn't lock up and was able to handle the load of emails.

Server Specs:

Athlon 2400+
512MB RAM
2 x 70GB HDD (mirrored)

The primary use of the server is file sharing & emails.

I read the oher thread about the server being sluggish - tried the expiring thing (I got desperate and set it to twice a day in a space of 12 hours apart) and that didn't solve the problem.

Only filters are:

Attachments
Spam Assasin
NOD32 Antivirus

I have the SMTP running on a separate port (not 25) and I have the No Spam Today accepting on all connections to port 25 and it sends the filtered mail to localhost on the port the SMTP is accepting.

Any suggestions as to why it would be locking up? What emails (or filtering) could cause this?
