
Subject: Timeout waiting for SMTP client

I have a problem with some large mails timing out and being resent constantly.

A few minutes after the first entry in the log (can vary by 2-10min.) i see this in the detailed logging of NST: "Timed out waiting for SMTP client - closing"

A sideeffect of this is that the mail is then resent by the sending mailserver again, but fails again. The big problem now is that the mail is actually received by our user, so by the end of the day there will be 100 duplicates in their mailboxes. (very strange)

The sending servers are on different connections from plain modem, ISDN to DSL. They are running Kerio Winroute Mailserver (older and new versions)

We have an Exchange 2003 and an Exchange 5.5 behind NST depending on which domain the mail is for.

I don't see the pattern in this as it is different sending and receiving servers but any help would be appreciated.
