
Subject: Filter e-mail by address?

I have been testing out NST for about a week and it has been working great. However (you knew that was coming), today I had 76 messages get through, all with viruses (the attachment filter & f-prot didn't catch them). Again, however, none of these messages were to legitimate e-mail addresses. So, is there any way to have NST accept & filter specific e-mail addresses and bounce all others? The only option I found was filter or don't filter based off of e-mail address.

Thanks
/SloppyB
