
Subject: New filter type ?

Hi there,

I run a mailserver in an environment, where we send out 30-40.000 emails a day, to different users of our websites - email addresses are up to 5 years old (since the user registered).

This obviously gives us a lot of trouble with "bouncing" emails, as many email addresses dont exist anymore, users inbox full and so on.

Today, these emails go into my Exchange Server 2003 store (right thru the NST proxy) - then I have som rules with puts these "returned" emails into a seperate folder, which I delete manually every 2 weeks.

But everyone familiar with Exchange, knows that this is a "heavy" and slow process.

Couldnt it be nice with a generic filter in NST, where you could query on each incoming email on the "generic values" like "subject", "from", "to", "body".

Then I could make a filter like this (inspired by the email rules in Outlook) :

if subject like "Undeliverable email" then accept/delete message!

This way my emails are "killed" on the incoming SMTP proxy level, instead of filling my Exchange Server 2003 store with emails I need to delete manually.

It takes quite some time to delete 150.000+ emails from one folder in Exchange Server 2003 :))

So, is this a good idea and any hope that a thing like this could be implemented on the SMTP (No Spam Today) level ?

Regards,
Tony Fonager
