Hi,

Since I installed VirusScan on the NST server, I have been getting client disconnects from legitimate servers (such as AOL); and the mail attempts many times to send the message, eventually it goes through. My delay filter is set for 30 seconds and my filters are in this order:

- 1.) Attachment Filter
- 2.) Delay Filter
- 3.) AntiVirus
- 4.) SpamAssassin

they pass the delay, but sometime after they are scanned for viruses and before SpamAssassin looks at them, the server disconnects (roughly at the 1 minute mark). I was wondering perhaps if the SMTP session is now too long even for legitimate servers with the 30-second delay filter, or should I leave the settings as-is?
