Could you add a configuration option for the dnsrbls filter that makes it possible to define the amount off points a mail gets by dnsrbl check ?

Problem now:

A customer from domain xyz.com (e. g. with usually -2.1 points) starts travelling and gets a dynamic ip. His mails is rejected by the dnsrbl filter, because the dynamic ip ist blacklisted.

Better:

If he would get e. g. 4 points for the DNSRBL Filter thje mail would pass because of his AWL-Score. (the same way the spamassassin integrated DNSBL feature works).
