Hi, recently we upgraded our McAfee VirusScan Enterprise protection from v8 to v8.5 and soon after that discovered that NoSpamToday stopped working correctly (we started to receive mails without subject and data).

To temporary correct the error I removed AV filter from NoSpamToday. Now I'm trying to figure out how to configure AV filter with new McAfee product.

McAfee stopped using scan.exe and now they seem to come out with new program csscan.exe

command line for McAfee AV in NoSpamToday to make it work again?

Thanks for the help, Luka
