---

We have just installed V3 on Windows 2003 server as a trial.

Since we saw that the new versions dont come with prepopulated Dbs we tried a shortcut by pasting the DB folder and the .cf file from an old version of 2 we had tested earlier.

It works perfectly for a while and then gives an error Event ID 101, Source ESENT, error the database engine stopped

Is there any way we can use the old database with the new version.

Regards

Sanjay A
