Hi there,

is it possible to turn off the SPF checks? Some of my incoming mails are from a tool that connects to a POP3 Inbox and delivers mail to my mailserver. So the IP-address of the connecting SMTP client is the IP-address from my server (192.168.0.101).

1.1 SPF_FAIL SPF: sender does not match SPF record (fail)

[SPF failed: Please see

<http://www.openspf.org/why.html?sender=uk.customerservices%40example.com&ip=192.168.0.101&receiver=tserv.txr.local>]

Because of this, every SPF check on a POP3 mail which comes from a known SPF host will fail

"tserv.txr.local rejected a message that claimed an envelope sender address of uk.customerservices@example.com.

tserv-001.taxacher.local received a message from 192.168.0.101 that claimed an envelope sender address of uk.customerservices@example.com.

However, the domain example.com has declared using SPF that it does not send mail through 192.168.0.101. That is why the message was rejected."

Is it possible to disable this SPF checks? How can I disable this SPF checks?

Kind regards,
Markus
