---

Has anyone implemented AVG version 8? A client of mine was using AVG 7.5 (networked edition) to scan his email and everything was just fine.

With AVG8, things have changed a little bit (the command line scanner is now called avgscanx.exe) and every email is given a code of 2 and deleted.

NST support indicates that this indicates an error (cannot open file, etc.).

I'm stumped. Any pointers would be very much appreciated.
