We've just upgraded to the latest version having been running the older version for some time. Some nice new features in there but am I right in saying that there still isn't any way for users of Outlook/Exchange to automate the learn process for spam that gets through?

With the old version we had a real fudge of a mechanism whereby users moved the email into a shared mailbox. IT admin then periodically used Outlook Express to collect all the messages from this mailbox. A 3rd party tool (DBXTRACT) was then used to write the contents of the Outlook Express mailbox into EML files which could then be run through the SA-LEARN program. As I said, a real fudge.

I was kind of hoping that this had been improved in the new version.

BTW - has anyone else found a tool that works with Outlook that can export a folder in Outlook into single EML files? It's probably not that hard to write an Outlook macro to do something similar to DBXTRACT.

Cheers, Rob.
