Hi,

I recently downloaded these rule files:

<http://www.sa-blacklist.stearns.org/sa-blacklist/sa-blacklist.current>

<http://www.sa-blacklist.stearns.org/sa-blacklist/sa-blacklist.current.uri.cf>

Because they are extremely large (the first one is 12Mb and the uri blacklist is 3.7Mb) our NST server started working *VERY* slowly and we didn't receive any emails at all.

Do you know if those rule files are really effective? if so, how much memory should I use on our server? it already has 2Gbs of RAM and it handles about 80~100 concurrent connections.

Thanks,
Yuval.
