Putting the line

trusted_networks 192.168.0.

in my local.cf file (actually I put it in my user-prefs.cf) has gotten a lot of RBL checks working that originally were not. Depending on if the spam came through another relay which was listed after mine in the headers. If my header was the last one it seemed to say "trusted" and not to RBL checks. The above fix told it to ignore my IP and use another (the bad one).
