Hi there,

A question which is really bugging me at present and am posting here in the hope that someone else has found an answer as I continue to scour the net ...

I want to teach SpamAssassin of ham eMails that were incorrectly flagged as SPAM.

All tools/utilities to do this point at a mail folder.

I want to point a text file at the sa-learn, as I am using Lotus Domino and can easily spit out a text file (or continuous text string) to the sa-learn.

Has anyone come across this?

Regards
