One feature I could really use it the possibility to whitelist sending IP addresses fx. 192.168.1.*

Fx if you don't want to block intranet mail originating from fx. scanners and other hardware that doesn't use Exchange (in our case). Fx. we have a scanner that closes the connection after the delay filter, but then we can't scan.

Currently I have added our own domain to the sender whitelist, but this is a problematic workaround since some spammers use your own domain as the sender address.

Send all mail that originates in your domain to your mail server directly, bypassing NoSpamToday!.

There are several advantages: faster processing, less load on your server, a cleaner Bayes database, less chance of accidentally configuring an open relay.

Thanks.
I have done this now, works perfectly.
