
Subject: DNSBL Filter IP Whitelist

Can we have an exclusion list of IP addresses or reverse DNS names (with wild cards) such as *mx.domain.com which will bypass the DNSBL filter checks?

We would like to reject/delete the messages from blacklisted hosts but pass known machines.

There is no need to repeatedly check our backup MX or ISP servers and worse still if one gets blacklisted overnight we could reject a lot of our own inbound mail...

Thanks
