Subject: Public Folders name in another language

Posted by luckzago on Fri, 01 Dec 2006 13:33:32 GMT

Hi. We are in Brazil and we use at our company an Exchange 5.5 server (English version). For some reason in the past (many years ago), during the installation the "Public Folders' was named in Portuguese. We've created a customize .CFG file with the parameter "Path=Public Folders/" (in english), but when IMAP2mbox runs with --debug parameter, it returns the following:
> *===*
> The Public folder path is Pastas p&APo-blicas/_TESTE
> The output mbox to C:\SPAM\spam.mbox
> CAJPLPE00:143 PLP/LZAGO/LZAGO
> Pastas p&APo-blicas/_TESTE C:\SPAM\spam.mbox
> The server is: CAJPLPE00.
> Folder List:
> Caixa de sa&AO0-da
> Mensagens exclu&AO0-das
> Contacts
> Notes
> Journal
> INBOX/ARQUIVO
> Rascunhos
> Mensagens enviadas
> Tasks
> INBOX
> Calendar
> Pastas p&APo-blicas/_SPAM > Pastas p&APo-blicas/_MALA DIRETA
> Pastas p&APo-blicas/PLP Subsidiary Contacts
> Pastas p&APo-blicas/_TESTE > Pastas p&APo-blicas/Internet Newsgroups
> "Pastas p&APo-blicas"
> Fri Dec 1 11:10:14 2006
> E-mails to process / 1 - messages selected
> Msgs:
> Extracting mail from: Pastas p&APo-blicas/_TESTE is complete.
> Mail written to mbox: C:\SPAM\spam.mbox

It doesn't work even using "Path=Pastas p&APo-blicas/" (in portuguese). Could someone please help us?
Thanks a lot.

My path and folder option in the spam.cfg file looks like:

Path=Public Folders/
Folder=SPAM WASTEBASKET

Your's should be:

Path=Pastas p&APo-blicas/
Folder=_TESTE

I am somewhat puzzled. I think it should work. It might be useful to see more of the spam config (spam.cfg) file... but please strip off or change the sensitive information such as the server name, domain name, e-mail account, e-mail alias to "server", "userid" and "alias". Something like: Name=domain_name/userid/alias Also delete the "magic" line and the timestamp from the file before you POST IT. All these pieces of information combined together could provde access to your e-mail host.... and you really don't want that! Also can you verify that _TESTE mailbox contains several e-mails. Was anything written to the C:\SPAM\spam.mbox?

Hello,

quite an old post, but I can confirm, that in the German Exchange version (Ex5.5 as well as EX 2003) there has to be used the name dispayed in the logfile when running IMAP2MBOX in the debug mode.

Nevertheless you have to make a config-file first. As this is usually a thing you do only once (after some testing session ;) I put the --debug and --verbose option to this file.

From there, I can extract and copy / paste the "real" Public Folders name to the batch with which I create the configfile.

Best regards
Michael
