Hi

I am having trouble using the IMAP2MBOX app. When I create a config file everything seems to be ok. The mbox is being created and the mails are being deleted from the "Public Folders\spam" folder.

The problem occurs when I run the learn spam batch file, I get the following error

IMAP login failed: 1 NO Logon failure: unknown user name or bad password.

I have created countless .cfg files that all log in ok and count the emails and delete them, but when I use the cfg with the batch file I always get the same error. I have even built a second exchange server (clean build) to try it on and I get the same results.

Please help

Regards

Will

Can you open a cmd box, run the bat script, then copy the ".bat" command line as well as the messages displayed. Paste them into a message box in this thread.

It sounds like when you run it interactively - it works. But when you reference the config file - that fails?

Are you by any chance creating the config file in one directory, then copying it to another location?

The reason I ask is that as part of the filename and path is used as part of the password encryption process. If you move the config file the password would not decrypt properly.

Hi

Here is the batch file

```
rem learns an mbox mail folder as spam
rem
rem execute this batch in installation directory
rem
rem imap2mbox has been previously configured to read from the mail server and
rem export the emails into the mbox container called "spam.mbox"
rem
rem
rem A logfile called spam.log is created so we can monitor the activities of
rem imap2mbox and spam-learn. Spam.log should be deleted periodically
rem
del spam.mbox

echo *===* >> spam.log

imap2mbox.exe --config="spam.cfg" >> spam.log

if exist spam.mbox sa\sas-learn -C sa\ruleset --showdots --spam --mbox spam.mbox >> spam.log

sa\sas-learn -C sa\ruleset --showdots --force-expire >> spam.log

sa\spamassassin -x -C sa\ruleset --lint >> spam.log
pause
```

When I run it I get this error

```
C:\Program Files\No Spam Today!>echo *===* 1>>spam.log
```

```
C:\Program Files\No Spam Today!>imap2mbox.exe --config="spam.cfg" 1>>spam.log
IMAP login failed: 1 NO Logon failure: unknown user name or bad password.
```

```
C:\Program Files\No Spam Today!>if exist spam.mbox sa\sas-learn -C sa\ruleset --s
howdots --spam --mbox spam.mbox 1>>spam.log
```

```
C:\Program Files\No Spam Today!>sa\sas-learn -C sa\ruleset --showdots --force-ex
pire 1>>spam.log
```

yes it works great when I run it interactively, and I do not move the config file after its created.

Thanks

Will

please add the --debug and --verbose switches and run it again as a batch job. Then include the output. Also try the config switch without the "quotes" on the file name..

When you run the batch job is it running in the same directory as when you run it interactively? I.E. when you schedule a job - Windows will allow you to specify a directory.

Hi

I have tried the config switch without the quotes, and I get the same error. I will add the --verbose and --debug switches and post the output here.

Could you also post the config file that is generated... but alter your user name in the file first (change to xyz)... and delete the timestamp plus "magic" lines. This will allow me to try to figure out why the batch process isn't working.
