Hi,

just trying to use IMAP2MBOX with IMAP server (hmailserver). After I got through docs I am able to create .mbox file from IMAP folder content. But when I look into the content of .mbox file, there are only headers of messages followed by clause "This is a multi-part message in MIME format. "

So there are only headers in my .mbox file. I'm not sure if this is the correct behaviour - does spamassassin learn only from headers and not from message body? If this is not correct behaviour, what could be wrong?

Petr

Spamassassin needs all parts of the message. Please add the "--debug --verbose" switches to command line when you run IMAP2MBOX. Copy the resulting output and clean any sensitive (private) information such as passwords from the output.

Then either post the text into this thread or send to me at "dennis -at- heidners -dot- net" change the "-at-" and "-dot-" to "@" and "."
