Hi!

Is there a list somewhere on the net of available dns based RBLs that I can use to connect my SpamAssassin?

I noticed that many spam messages (in hebrew) contain phone numbers and addresses, so I created a rule that blocks them, but if such a list already exists as a RBL it could save me a lot of bother...

P.S

Can you send me a link to a technical document about the RBL check protocol?

Thx
Yuval.
