Hello

If NST identifies a Mail a spam, it adds the X-Spam lines to the header and the results of the analysis to the body of the Mail.

But what if this was a false positive and I want to learn this mail as ham?

Would NST ignore its own modifications so that I can I sill learn this (modified) mail using sa-learn ?

Greets,

Marc

Yes, SpamAssassin is aware of its own modifications, sa-learn will ignore the X-Spam headers.
