I have now been able to set up my domino where I can send them to a POP3 account, then I can download the email with Thunderbird in a format that sa-learn can read.

Now, after doing all that I had about 161 messages for sa-learn to learn. So I run sa-learn and heres what I get:

```
e:\NST\sa\sa-learn --spam .\SpamMail
```

```
No Configuration text or files found. Please check your setup.
```

```
Learned from 6 message(s). (12 messages examined)
```

```
e:\NST\sa>_
```

So did I do something wrong? I had 161 messages in that mbox located in the SpamMail folder located under the sa directory.

Welp, I answered my own question by reading this:

<http://www.byteplant.com/support/nospamtoday/howtolearnspam.html>

:)

It finished and said:

```
Learned from 159 message(s). (162 message(s) examined)
```
