Hi there

A quick question for those clever people out there .... cos myself and others at my company can't work this one out!

We get a lot of SPAM at the moment from a person's name ... and the subject is the person's first or surname ... and it's SPAM

How can we setup .CF rules to capture this? So the subject = the first name or the last name?

Thanks very much in advance!!!

This would be very hard if not impossible/impracticable as far as I know. You could add custom keyword filters in your local.cf file, but you'd have to create one for each name of each person you want to filter for. If you don't have that many people, its not that bad, but for me, it would never work, as I have hundreds of names I receive mail for.
