Hi,

We are currently evaluating NoSpamToday SMTP Proxy, and it seem we have a limit in the number of addresses we can filter. The "AdressList=" line cannot have more than 4050 characters, and it limits greatly the usefulness of the filter. When the line is longer than 4050 characters, the service refuses to start. Is it normal?

We have to specify such a number of addresses because of virii that send mail to random names, and exhaust the allowed number of addresses filtered by NoSpamToday. How is the licence enforced, and do fake addresses count towards the licence limit?

I have this concern as well, and am currently evaluating the software. I have been running the software for only 3 weeks now and already it says it is checking over 600 email address when I only have < 100 email users. This is due to viruses as stated in the above post. I do not want to add all 100 email users to the address list but if I have to I guess I must. I have not done so yet but I am very concerned by lebig's post that this may not be an option. I'm only looking at about 2300-2400 characters tho, if I estimate based on an average of 23 characters per address.

This was fixed in version 1.2.2.2, so this should not happen. Could you perhaps mail us your log and config files (nospamtoday.log, nospamtoday.cf) when this happens?

Preferably you should configure your mail server to reject unknown addresses outright. The non-delivery reports e.g. Exchange creates otherwise may be a problem for the admins of other mail servers, because they almost never are delivered to the right person anyway. Look here for a discussion of this topic:

Please take a look at this howto document, if you haven't already, it should apply to your situation as well:

Hello,

I have just do this for a number of more than 1150 addresses... then the service will be aborted in a few seconds. For fewer addresses it's functionable. I have also the trouble, that Exc. 5.5 in a 3-way design (external e-mail-server spam-filter internal e-mail-server) with faked addresses with our domain-name after the mailboxname will be bombed. And I have no chance, I have to accept these e-mails and to deliver ndr's.

It is not possible to disable NDR within Exchange 5.5. I have read dozens of articles without getting positive results.

It's tragic, but this form of e-mail, allowed in RFC's will be the death of smtp.

Greetings

Did you already upgrade to Version 1.2.4.4?

Should the address list be comma separated?

No. Please use blanks to separate the entries.

Use the 'restrict spam checking to' setting. You can configure it on the 3rd or 4th page of the admin wizard.
