I just upgraded to 2.0.1.1 and it looks great. Is there a way to filter incoming email so that anything TO any address not listed in the "address patterns to enable filter" list is rejected?

This is best done in the SMTP proxy port settings, on the open relay protection page. Enter only the addresses you want here, all other recipients will be rejected.

thanks! I just had \*@domain.com in there, I don't know why I didn't think of specifically listing every address in there before.

Thanks again,  
James
