Yesterday I downloaded the NST Proxy installer. On the website version 2.0.1.3 is the current version but the downloaded NST Proxy shows 2.0.1.4 (!) as its version number...

What has been changed in this version? I'm asking because sometimes the attachment filter in version 2.0.1.2 had some problems with special characters within the filename and therefore it blocked the attachment...

This version only fixes some installation issues of version 2.0.1.3.

Nothing was changed in the attachment blocker. There was a problem, but that was fixed in one of the early beta builds (2.0.0.15).

The attachment blocker does not accept attachments with filenames that are illegal for NTFS or FAT filesystems:

/?\:*|"
