Emails that are rejected have a generic subject of

"Returned mail: see transcript for details"

Nothing about SPAM is in the subject.

No * Rejected by No Spam Today* as it is in the configuration setup.

Here's the setting in my local.cf file.
rewrite_header subject * Message Rated SPAM *

The message is created by the transfer agent trying to send the mail. This is not under your control.

If you want to change the subject of returned mails your users get when they try to send undeliverable mail, it might be that your mail server software allows you to configure this, but I doubt it.
