Just testing the trial version at the moment and need some info and advice if possible.

We're running the NST on a Celeron 2.5 ghz with 256mb of ram, Win XP Prof - i haven't found any hardware min spec for NST - would this suffice, or would more ram be preferable?

Also, I've set the auto Reject and Delete setting to 5.7 and the other setting to 12.0 (as was advised on one of the posts, but I have to ask, which is higher? 5.7 or 12.0? I can only find entries that 5.0 is aggressive, but what's passive?

Having set it at this level i received some emails, but then gradually found that more and more emails (even ones that had been previously let through) were being tagged as SPAM - even when they were obviously not - and been rejected.

And finally, after having made each policy change to a filter do i have to restart the services? or will NST automatically apply the changes made?

Sorry but i really can't find any info on these questions, hope someone can give me a few pointers!

thanks

anthony

It depends on the traffic you have to handle. With this configuration, you will be able to filter around 1500 messages per hour. With Windows XP, more RAM is always nice.

The more spammier the mail, the higher the score. So decreasing the threshold is even more aggressive. Passive is in the range of 6.0 to 7.5.

It depends. Changes in the SpamAssassin config are applied immediately after finishing the wizard. Other changes are applied only when you choose to.
