Greetings,

I have a brand new server set up with Windows 2003 Server and Service Pack 1. No other software has been installed. When I install NST SMTP (latest version, downloaded today), the installation appears OK, but the service is not able to start. Do you have any information on why this might happen or how to troubleshoot?

Thank you,
Dalton

NoSpamToday! SMTP Proxy is fully compatible with Windows 2003 Server SP1.

I assume that there is already another application listening on port 25 (possibly a pre-installed SMTP server) and thus the NoSpamToday! service can't bind to this port on startup.

Please check your nospamtoday.log file to find out more.

I am running it on Win2003 with SP1 and I've had no trouble at all. My mail server listens on a different port, and NST forwards the messages over just fine. I would check to see if you have the Microsoft SMTP service running.
