Quick question, if I may...

If I leave the NST admin program running on the server console and then need to RDP into that same box (from a remote location, for whatever reason), is it ok to run the NST admin in that terminal session? So, basically, the server would be running two instances of the NST admin. Will that hose anything up? I assume it just "monitors" and doesn't really do anything aside from using up the additional resources to run the second instance.

Thanks...

You will get a popup message only when you run NST Admin a second time. You have to kill the NST admin instance running on the server console first before you can start it on the terminal session.
