Please bear with, new to this stuff. I have a Windows 2003 server, with McAfee virus and firewall. I have been able to send and receive, via relay, emails. However as of late have had a problem with NDR spamming. So downloaded software and installed. Can get email, however when I try and send an email it times out. I figure I mis-configured the software somewhere. Suggestions please?

Is outgoing mail routed through NoSpamToday!? You shouldn't, there is no need to.

Check the log file, maybe turn on detailed logging, there will likely be a hint what is going wrong. If what you see in the log is incomprehensible, please send it to us, at nstsupport@byteplant.com, so we can have a look.
