Is it possible with NST or is it simply for checking incoming mail.

I would like to offer to my customers the ability to be able to virus check their outboundmail as well as check their inbound mail for spam.

Can this be done with NST?

The answer is yes, but with several "ifs".

- the customer's outbound mail must be submitted by SMTP to the NoSpamToday! Proxy for delivery, and the recipient should be the customer himself, otherwise your license count goes up
  - the customer must *\*not\** use SMTP AUTH in this transaction, because the latest version (2.3.3.1) does not filter messages in authenticated SMTP sessions
-
