It appears that no-spam-today (at least for the anti-spamware) uses the server's physical name? Is there anyway to override this and just use the domain name or something else?

I want my users to see USPOSTMAIL or USPOSTMAIL.COM not SERVER19

-Dave

This is an important topic for our company, as well. We have a lot of users who would receive the email and not understand what the computer name meant.

In fact, we were hoping there was a way to outright define and customize the marked-as-spam email message?

You can fully customize the Spam report by editing the report template in the 10_misc.cf file in the sa\ruleset subdirectory of the NoSpamToday! installation directory. The default looks like this:

```
report Spam detection software, running on the system "_HOSTNAME_", has
report identified this incoming email as possible spam. The original message
report has been attached to this so you can view it (if it isn't spam) or label
report similar future email. If you have any questions, see
report _CONTACTADDRESS_ for details.
```

```
report
```

```
report Content preview: _PREVIEW_
```

report
report Content analysis details: (_SCORE_ points, _REQD_ required)
report
report " pts rule name description"
report ---- -----
report _SUMMARY_
