Hi all,

how can i configure the SNT-Proxy-Service, that it authenticates on our web-proxy when it looks for updates eg. ? I always receive mails from the service with the "403" Message of the proxy .. any ideas ?

Web Proxy is an ISA 2004.

Many thanks in advance.

Markus

On the "File" menu, look for global settings, then select it, about the fifth screen in the global settings is a choice for changing the HTTP PROXY Update, specify the same server and port that you typically use for your IE browser sessions. For example that might be something like MY-ISA-PROXY:80 where 80 is the port that all http proxies are suppose to use.
