Is there any way that I can get NST to listen on 25 (for normal stuff) and also to listen simultaneously on 3325 (for users visiting behind client firewalls who block outbound 25)? For example, could I possibly run two instances of NST, one listening to 25 and the other listening to 3325, both feeding our SMTP server on its listening port of 2025?

Yes, just add a second SMTP port with the appropriate settings, and with the filters you want.

How? In the SMPT config wizard, if I separate with a comma (25, 3325), it gives an error message. If I separate them with a space (25 3325), it accepts it, but listens only to whichever port is named first. Or should I name the two ports in the cf file? If so, how?

In the "Proxy Setup" menu, select "Add SMTP Proxy...".
