It seems when I put email addresses in the "Select Recipient Addresses" on the delay filter wizard in the "Addresses to disable filter" field it still goes thru filter. Do I need to put in something in the "Addresses to enable filter" section also or leave it blank? Leaving it blank doesn't work.

Thanks  
Mike Fisher

We have two test cases that should cover this scenario, and so far all released versions have passed both without errors.

If you are sure about this, please send us your particular config file, and a log excerpt with the evidence (detailed logging enabled) to nstsupport (at) byteplant.com.

Thanks for your time, I re-entered email addresses in "Addresses to disable" and it is working now. The only thing I change since last time was that I was having a problem with the Database expiry timing out, leaving alot of bayes\_toks.expire files. So I added bayes\_auto\_expire 0 to the local.cf file as per your manual and use expire.bat. The program runs faster now through the filters.

Well, I thought it was working but all email was bypassing filters that were set up with "Addresses to disable filter". So I limited the email addresses to just a few in this field and everything is going through filter again. I will send you log..

Thanks

My mistake, I was trying to bypass filter with sender's address instead of receiver's address as it is programmed for.
