Hi.

I have 3 Domain Names.

Each domain has a mail server with different ip and they are all located on a different server.

I tried to create more then one smtp proxy but only the first one worked at a time-only one relayed the mail.

What do I do wrong ?

Thanks,

Hayim C.

I am guessing that at the present time NST would not support that configuration OR that you would need three different NST instances running. I suspect the problem happens because NST is acting as a mail proxy - and you can only configure in the name/IP/port of one mail server that it proxies for...

You should e-mail NST tech support with your specifics and configs.

I'm not associated with NST - just a user myself.....

Thanks for the quick answer just a user... !

Fact, most answers you get from users.

And I thought that the configuration is regular.

If I have more then one domain, I prefare giving each his own ip address.

The interesting thing is that I can create more then one smtp proxy, but only the first one I created is working.

I have to look for a different product.

Any recomendations ?

Your setup should be working, and is certainly supported. Please contact us at nstsupport@byteplant.com to get your problems sorted out.

Please include the following:

- your configuration file: nospamtoday.cf
 - any error messages e.g. in the log file (nospamtoday.log), maybe you can send your log file (or part of it) as well
 - a description of the setup you want
 - some information about your OS and hardware
-
