the mail server is set to closed relay, but has the spam filtering server as a trusted server...

I have this problem;

Mar 09, 2007, 15:38:32 Session 2: Connection from 218.53.105.174 accepted on 192.168.6.3:25

Some attempts get 'unknown user' with postmaster, but other attempts seem to accept it?

there is no acceptance for the postmaster email address set up in NST (when specifying the filtered email addresses), so I have no idea why it is accepting that address as being allowed?

that, and it doesn't filter the mail at all (as you can see above)

The only recent thing done was a server hardware upgrade, with windows repair + drivers installed.

Then with the new version of NST out, that was recently upgraded a day later, hoping to solve this problem....

what could cause this?

It looks like your mail server considers the IP address NoSpamToday! uses as trusted and thus accepts all recipient addresses for relaying without checking.

To avoid this behaviour you can either

- change your mail server's configuration to consider NST's IP address not as trusted

or

- change your mail server's configuration to allow relaying only for SMTP AUTH connections

or

- use the Open Relay Protection in NST to explicitly specify the list of recipient addresses/domains you want to accept mail for.
