Hi,

I've currently testing NST on our Exchange 2007 server on a Same Server and Same IP Address configuration but used different port below. I'm using Cisco PIX 501 firewall.I've opened Port 26 on the firewall but I don't see any mails passing through on the NST. Is there anything I've missed on the configuration? on Exchange? or NST ? Firewall?

Would appreciate it much for your help. Thanks.

Incoming IP: All interface
incoming Port : 26

Outgoing Server:
Outgoing Port : 25

Dennis

Don't open port 26, instead forward port 25 (Internet) to port 26 (Incoming IP).
I suppose the Cisco PIX 501 is capable to do this.

Ok. I'll check on our Cisco Pix vendor about this one.

One more thing, how about on Exchange Receive connector. Do I still need to create a receive connector or modify the existing one which is "Default" connector? Thanks.

As long as there are no port conflicts or relaying problems, you should be fine.

Now, all my incoming mails are now passing through NST. I'm using v3.0.3.6 Trial Version.

Once I start the NST service and began to process all my incoming emails but I just noticed that all of a sudden the service suddenly shutdown. So, that means all incoming mails are not coming in. Once I started the service again manually, it began to process the incoming mail again.

NST Service shutdown many times.

To help us find the problem, please mail your log file (noSPAMtoday.log) to nstsupport@byteplant.com.

Be sure to set the NST service on automatic restart. This way the mail service will be disrupted for only for a few minutes.

SMTP is fault-tolerant, so you won't loose mail.
