Everything seems to be functioning normally, emails are coming in and being filtered etc, but when using the NST admin interface, when I attempt to look at the "log" or "report" tabs I get a connection refused error. However, it does show me the log and/or report. I checked the "File, Connect" setting and have it set to "localhost:8086".

Thanks

Kevin Steutermann

If it works, it works. Maybe only the first try failed, or the service was not yet up and running.

Same with me. I have running the latest release of NST on my production server without any problems. But on another server with Small Business Server and Exchange, I can't connect the Admin Interface to the service.

What happens if you do a "telnet localhost 8086" on the SBS machine?

I can't connect to port 8086 via telnet. No firewall running.
It's a standard SBS installation out of the box.

I seem to be having this trouble as well. I can fix it by removing the changes I made to the configuration that pushed the size of the nospamtoday.cf over 98kb.

I can make whatever configuration changes I want and they work just fine as long as the config file stays below. However as soon as the size of the disk is 99kb or greater and the admin tool no longer seems to be able to read it.

The admin wizard on the windows version may have an issue with nospamtoday.cf files larger than a certain size. On my system this size seems to be 99kb or larger. Once the file reaches that size (either by adding new proxies or new options to existing proxies), then the wizard no longer works. I can't really tell for sure if the service stops working also, but this seems to be the case.

I have submitted a pair of emails to techsupport with the particulars of my system and examples of working and non-working config files.

I guess we'll just have to wait and see what the answer is.

We did not anticipate the need for configuration files as large as this. We will increase the limit in one of the upcoming releases.

I have the same problem with a new, trial installation on SBS 2003 R2. I am using the latest version of NST - 3.0.4.4. Everything works except the admin interface.

A telnet to localhost 8086 fails. Is it possible this is on a different port number? How can I verify?

Thanks

Forgot to mention that my NST.CF is only 1KB.

I have the same issue with a new, trial install of NST v3.0.4.4 on SBS 2003 Sp2. Everything works except the admin console.

I can not telnet to localhost 8086. How can I tell which port NST is using?

My NST.cf file is only 1kb.

You'll find this info in the log.

The SBS has an SMTP service running, did you already disable that? If you did not, the NST service will fail to start.

Perhaps it is worth a try to change to a different port, e.g. 80 (if you have no web server running on this port)

You can change the default admin server and port by adding the following lines to the HTTPPort section of the config file, like this:

```
IncomingServer="localhost"
```

```
IncomingPort="80"
```

Now you can try telnet to localhost 80.

In the admin console, you can change the connection settings to localhost:80 (File->Connection).

The SMTP service, ports and IP addresses have been configured correctly.

As I said in my post twice ->"Everything works except the admin interface."

I looked at my configuration file and found that there was NO [HTTPPort] section in the file. I

added the section and included

```
IncomingServer="localhost"
```

```
IncomingPort="8086"
```

Restarted the service and everything worked fine.

I REMOVED these two entries but left the [HTTPPort] section header in the file.

Restarted the service and everything worked fine.

The missing [HTTPPort] section in my configuration file was the cause of the problem.

Thanks for the assistance.

I can also confirm this on version 3.1.2.1

Same problem, no admin interface with the connection failed. I too was missing the [HTTTPort] section in my config file.

Added it manually and restarted the service, everything worked great.
