Hi, recently we upgraded our McAfee VirusScan Enterprise protection from v8 to v8.5 and soon after that discovered that NoSpamToday stopped working correctly (we started to receive mails without subject and data).

To temporary correct the error I removed AV filter from NoSpamToday. Now I'm trying to figure out how to configure AV filter with new McAfee product.

McAfee stopped using scan.exe and now they seem to come out with new program cscan.exe

command line for McAfee AV in NoSpamToday to make it work again?

Thanks for the help, Luka

From the McAfee forum: <http://forums.mcafeehelp.com/viewtopic.php?t=101573>

We suggest that you get in contact with their support team directly to resolve this issue.

OK, I'll contact the McAfee to see what they have to say about this. By the way, on the McAfee forum link that you forwarded me to is the line: "They said the vendors who will be using their products will have to contact McAfee so they can get information on how to better implement their systems." ;)

When I'll know more, I'll post back this forum.

After I have exchanged few mails with McAfee support this is their last answer:

"It is regarding the case registered No.xxx virusscann and scan.exe

- 1) Checked with the next level and have suggested to check using cscan.exe
  - 2) We do not support the use of 3rd party our product as a plug in with a third party application"
- (end quote)

Is it possible that NoSpamToday contacts McAfee regarding this issue and find the appropriate solution?

Luka

We will try and see if something can be done, but it is unlikely that a short-term solution can be found.

For the time being, leave the older version on your NST server for mail checking purposes.

Yes, live the old VSE 8.0 on until they come up with something.
