Just upgraded to version 3 on our aging NT 4 server and it's gone ahead pretty well. Couple of points:

1. The "Add filter" button on the configuration dialog doesn't work - fortunately the menu items to add the black and white lists work
2. I registered our new license but it still says unlimited. Ohh hang on, just checked again and it's changed so ignore this one :)
3. On installing it couldn't automatically find the DNS servers which was worrying. I had to manually add them. They are listed against the TCP/IP settings but don't display either when you do IPCONFIG /ALL. This is a bit strange but probably not a fault of NST.

Has this upgrade updated the spamassassin database?

Thanks, Rob.

This is oddity pure. Perhaps the common controls DLL is too old to popup the menu. Probably there is no way to fix it, but as you mentioned there is a workaround.

Yes, NST installation on Windows NT requires that you add this setting manually.

No need to, unless you upgraded from NST version 1, but in this case it would have been done automatically.
