Hi,

I have 2 weird problems:

1. The program crashes/freezes and there is nothing in the log about it. So everything seems to be good, but then the program freezes. We have small traffic so the memory is enough.

2. Here comes the funny part...every thread seems to have a bandwidth limit of 40kB/s speed limit. The average traffic is 2-3 mails at a time so it means 80-120 kBytes/s and we have. Do anybody has any idea about how to allow every thread to use the maximum bandwidth?

Thanks for your help!

Some users reported crash problems, introduced by a Windows 2003 patch a few weeks ago. It seems Microsoft has since fixed this in another patch, so please check if you are up to date.

There is no such limit imposed by the NoSpamToday! software, and I did not observe anything like this so far. NoSpamToday! will receive the data as fast as it comes, though processing may take a few seconds per mail.
