We have our NoSpamToday for Servers set to reject/redirect to a Spam account within Exchange 2003. This account is then checked by someone from a Workstation. Somehow viruses are getting past the Antivirus check the NoSpamToday should be doing causing much concern on the Workstation when her antivirus program scans the email and finds a virus!!!

What could be the problem. I have checked everything and even sent the eicar test string which got deleted by NoSpamToday is instructed to do so. I have got the latest version installed 3.0.5.1

Virus checkers in NST are configured to scan messages only, so if you just reject/redirect the message, it will be forwarded to the spam account with the virus still intact.

If you have a virus checker that supports an option to sanitize messages, you can experiment with the AV filter settings, but it is probably much simpler to just reject/delete virus messages.

False positives with virus filters are far less common than with spam filters.

I think you may of misunderstood.

To clarify, Antivirus checking in NST is indeed set to reject/delete. If an incoming message gets marked as Spam by the DNSBL filter which is set to reject/redirect surely the Antivirus should still check the message for viruses before redirecting it to the Spam account.

OK, I see your point, and you're right, this is not expected behaviour.

Please send your noSPAMtoday.cf file to nstsupport@byteplant.com so we can have a look at what's going on. Please add examples of this thing happening (ie. log file snippets), OS version

information, and NoSpamToday! version information.

Unfortunately the lady who handles the Spam only clears them every few days. The log file for NST only goes back to the previous day and I therefore can't get my hands on it.

Is there any way of extending the number of old log files that NST keeps to say 5 instead of 1 ?

You can use the task scheduler to rename log files, or change the logging settings so that a log file lasts more than one day.

My apologies for not getting back to you before.

Another customer of mine has had a similar occurrence where the email marked as Spam by SpamAssassin has not been virus checked until it reached the clients Microsoft Outlook program where it was duly Quarantined.

I noted this time that the email had an attachment which was another email. That attached email contained an attachment which was an executable (exe) which was a trojan.

The antivirus on the SBS Server 2003 is Nod32 and appears not to be checking deep enough into the message.

Is there a way to change just how deep the antivirus scanner checks ?

Please check the manuals of your antivirus software to find out more about the scanning options.
