I have a new install of NST on a SBS 2003 system with a single network card.

I have configured the forwarding port to 26. I have changed the Exchange server for incoming email to 26 as well.

It appears to be working well with the exception of an 'open relay' warning.

What do I need to do?

Thanks!

You can either

1) Configure your Exchange server to accept only those recipient addresses you really want and to reject all other addresses.

or

2) Use the "Open Relay Protection" in the NoSpamToday! Admin wizard to restrict the set of recipient addresses to those you really want. This can be configured on the third page of the SMTP proxy wizard.
