I need help for NST for server.  
When I perform open relay test I have an error "Open relay check could not be perform...client error message"

Then I meet the message error "Client does not have permission to submit mail to this server"

Moreover, NST can't connect to localhost

What's the problem??? help please

The open relay check tries to submit a message to some other domain using your mail server. Make this message go away, this might be a problem of your mail server configuration.

> Moreover, NST can't connect to localhost

That's a very basic configuration problem. Please look at the installation chapter in the manual, especially the troubleshooting section.

Overall, I am having trouble to make sense from this.  
Check the logs, both your mail server's log, and NoSpamToday!'s log, and maybe send the relevant snippets to [nstsupport@byteplant.com](mailto:nstsupport@byteplant.com).

What type of box? Windows (and version) Linux?

firewalls active? dns configuration wrong? host file missing localhost?
