I am trialling the server edition in pop proxy mode and have tried adding a whitelist which has built up over years and is around 42kb in size and one address per line

this gets truncated probably around three quarters of the way through

I tried putting more than one address per line but after I got bored it still truncated although apparently a bit further down

is there any way to increase this limit or would it be valid to add a second whitelist filter and put half the list in each?

You can try to enter the whitelist directly into the config file (nospamtoday.cf). Be sure to use a text editor capable of handling line lengths of 42kb.

Individual entries must be separated by whitespace characters.

Use wildcard characters to shrink the whitelist if possible.

Using multiple whitelist filters should also work.
