Hi,

I'm evaluating the product and on a single server it's working quite well.
In the production environment there will be 2 or more server in load balancing running cleanmail.
There is any known issue on this configuration?
There is some special configuration option to set?
Many thanks.

Edika

You can run 2 instances of CleanMail on the two servers. CleanMail behaves like any other SMTP server, so there will not be any problems.

There is no special configuration option to set, both CleanMail installations can be administrated separately.

If both servers are exactly the same, you can maybe save time by copying the CleanMail.cf file created on one server to the other server.
(Of course only after modifying file system paths and network addresses as needed).
