Please help...

when i enable no spam today on an email account, i get the following error:

Task 'laservall-usa.com - Sending and Receiving' reported error (0x800CCC0F) : 'The connection to the server was interrupted. If this problem continues, contact your server administrator or Internet service provider (ISP).

When I disable NST for that account, I receive email fine. This happens with all of my email accounts on this computer.

Any ideas?

THANKS,

---

Open the config wizard to enable detailed logging, and look into the log file (nospamtoday.log) to see what happens. Probably the server name was misspelled, and NST is unable to connect.

Your POP3 settings must look like this (without the characters):

User name: :

---
